CONVERSATION RECORD

Individual: Dr. D. Keil Organization: Cal Poly Herb.

Time/Date: 7/11/97 Tele # _____

Subject: Morro Bay Plant Species

Pismo clarkia - (I faxed him map w/known sites). He's aware of one site not yet reported in NDDB: (see attached map). Surveyed 28 May 1992. Was on property owned by Silva, being considered for development. Hasn't been out there since, so doesn't know if site still occurred. Was not roadside pop (was on far side of field). His notes say "locally common in grassy fringe" in sandy soil near chaparral. I requested that he send in field survey form.

He's only seen one other site - w/Lyndee Oyler at Blk Lake Canyon.
Has always seen this clarkia in sandy soils. Didn't particularly notice ~~[illegible]~~ ~~preferen~~ any pref. for low ~~vs~~ density vs. high density grasses.

He believes Lyndee also found a pop in/near Arroyo Grande, slated for devel. that may not be on our map.

Eriodictyon altissimum - has seen EO 4 (Bayview/Broderson) and in the 1980s he & Lyndee found a site South of Indian knob ~~south~~ - closer to Pismo Beach. It was slated for development. He hasn't been back. Lyndee would have more info. Pop was robust on steep hill. Stood out above chaparral.

Action Required:

Believes fire might open up hab. for this sp.

Cirsium fontinale obispoense - familiar with Laguna Lake PK, Perfumo Cyn, Froom Ranch (not yet developed - Madonna (Alex) is owner. Mention of hog farming on site, rather than development for the short term.
Laguna Lake healthy. Seems to be OK as long as cattle ~~don't~~ ~~tra~~ aren't trampling Cirsium or knocking them over.
